

CSE 421/521 SYLLABUS: SPRING 2015

COURSE DESCRIPTION

This course is an introduction to operating system design and implementation. We study operating systems because they are examples of mature and elegant solutions to a difficult design problem: how to safely and efficiently share system resources and provide abstractions useful to applications. For the processor, memory, and disks, we discuss how the operating system allocates each resource and explore the design and implementation of related abstractions. We also establish techniques for testing and improving system performance and introduce the idea of hardware virtualization. Programming assignments provide hands-on experience with implementing core operating system components in a realistic development environment.

COURSE INFORMATION

• Course Staff:

- **Instructor:** Geoffrey Challen. I go by “Geoff”, “Geoffrey”, or “GWA”. Please use prof@ops-class.org to aid my email filtering. However, you should rarely contact me directly—they are instructed not to answer direct email queries. Instead, 99% of the time use the [forum](#), or 1% of the time contact the entire staff at staff@ops-class.org.
 - **Teaching Assistants:** Zihe Chen, Guru Prasad, and Jinghao Shi, are your fantastic and hard-working teaching assistants this semester. All three are returning from 2014 and know the drill. Please do not email them directly—instead, use the [forum](#) or email staff@ops-class.org for a faster reply.
 - **Ninjas:** In addition to the official teaching assistants, several former 421/521 students and accomplished programmers will be helping staff office hours and offer assistance: Jerry Antony Ajay, Yihong Chen, James Mazur, Carl Nuessle, Natasha Sanford, Sriram Shantharam, Ryan Smith and Mack Ward. (Ninjas will not do any grading.)
- **Times and Locations:** Always check the [online calendar](#) where times and locations are kept current. Changes do happen.
- **Lecture:** MWF 2:00–2:50PM, NSC 225.
 - **Recitations:** (1) T 4:00–4:50PM, NSC 205; (2) F 8:00–8:50AM, Knox 04. Both recitations will be taught by Jinghao Shi. Recitation attendance is not mandatory, and you can attend one, either, or both, depending on who is teaching them and which is more convenient for you. **Note that at this point we cannot accommodate graduate students in recitations due to space constraints.** If you are upset by this, please contact Professor Aidong Zhang (azhang@buffalo.edu).
 - **Office Hours:** We will schedule a large number of office hours based on the results of [this Doodle poll](#). Please participate so that we know what times work best! My office hours will be Wednesday from 11AM–1:30PM in Davis 301B.
- **Website:** www.ops-class.org. You will submit all programming assignments through the website. It also has links to the forum, course calendar, practice exams, lecture videos, and other useful information.
- **Forum:** Almost all course-related questions can be asked and answered on the [forum](#), and I will use the forum for important course-related communications. You should have been enrolled automatically; if not, the access code is “ops-class”.
- **Mailing List:** Occasionally course announcements will also be sent to ub@ops-class.org. All enrolled students will be automatically subscribed to this list; other students can subscribe at <http://www.ops-class.org/mailman/listinfo/ub>.
- **Preterm, Midterm, and Final:** An ungraded preterm exam will be given **Friday, January 30th** during class. The 50-minute midterm exam will be **Wednesday, March 25th** during class. The 3-hour final exam will be **Monday, May 11th**, at 3:30PM in NSC 225. All these dates are on the [calendar](#).
- **Prerequisites:** [CSE 250: Data Structures](#).
- **Other Important Dates:** (Also on the the [calendar](#).)
- **Last Day to Drop/Add:** Monday, February 2rd.
 - **Last Day to Resign:** Friday, April 17th.
 - **Last Day of Class:** Friday, May 8th.

EXTENDED COURSE DESCRIPTION

Operating systems are the masterworks of the programming world: beautiful and sophisticated solutions to difficult design problems that have emerged from years of effort by thousands of skilled programmers. Just like budding artists study the works of the great masters for inspiration, we programmers study operating systems. While most of you will never contribute a single line of code to a production operating system, we hope that by the end of “CSE 421/521: Introduction to Operating Systems”, you will have learned something from their elegance and maturity.

Understanding operating system design will make you a better software engineer, and struggling with operating system programming will make you a better programmer. CSE 421/521 gives you a chance to do both. We establish a *conceptual* track through lectures and exams, where we discuss the concepts and design principles of modern operating systems and how hardware devices such as the CPU, memory, and disks are multiplexed and abstracted. Equally important, however, is the *programming* track which proceeds through four assignments that give you the chance to implement core operating system functionality in a simplified development environment. After studying synchronization, you will implement synchronization primitives. After studying the system call interface, you will implement it. After studying virtual memory and address translation, you will design and implement a virtual memory subsystem.

Designing and implementing operating system concepts is not easy, and neither is this course. But we are here to help and committed to providing you with the support you need to succeed. Our online grading tools provide helpful feedback and allow you to repeatedly test and submit your assignments until you earn the grade you desire. And our TAs are experienced and will be available for many hours each week to provide individual help. We expect that you will find this course difficult, but we hope you will also learn a large amount, have fun, and develop a passion for computer systems.

STUDENT LEARNING OBJECTIVES

Learning outcomes for this course are divided into two categories: conceptual, and programming. Our goal is to provide you with an introduction to operating systems *and* make you a stronger programmer, debugger, and teammate.

Conceptual Objectives

When you finish CSE 421/521, you will be able to:

Outcome	Assessment
Understand the abstractions supported by modern operating systems.	Class and recitation participation, midterm, final exam. 70% correctly identified marks outcome achieved
Describe how operating systems safely and efficiently multiplex hardware resources through effective policies and mechanisms	
Analyze the designs and features of historical, current, and emerging operating systems	

Programming Objectives

When you finish CSE 421/521, you will be able to:

Outcome	Assessment
Design and implement working systems software	Office hours attendance, homework and programming assignments. 70% correctly identified marks outcome achieved.
Identify and correct bugs in complex, multithreaded systems	
Formulate and test performance hypotheses	

ABET OUTCOMES

The Accreditation Board for Engineering and Technology (ABET) helps guide curriculum by defining common outcomes that coursework should help students achieve by the time they graduate. CSE 421/521 should assist you in four of the nine University at Buffalo outcomes:

- (c) An ability to design, implement and evaluate a computer-based system, process, component, or program to meet desired needs
- (d) An ability to function effectively on teams to accomplish a common goal
- (f) An ability to communicate effectively with a range of audiences
- (i) An ability to use current techniques, skills, and tools necessary for computing practice
- (k) An ability to apply design and development principles in the construction of software systems of varying complexity

The table below describes how each outcome above is incorporated into CSE 421/521:

ABET (a–k)	Description
c	All four assignments challenge your ability to “ <i>design, implement, and evaluate</i> ” components of an operating system.
d	All four programming assignments are performed in pairs, helping you “ <i>function effectively on teams to accomplish a common goal</i> ”.
f	Preparing design documents is an integral part of the two large CSE 421/521 assignments, providing practice at effective technical communication, part of the ability to “ <i>communicate effectively with a range of audiences</i> ”.
i	CSE 421/521 requires students to develop in a virtual machine, use Git for collaborative development, and use modern debugging and code editing tools, all preparing you to “ <i>use current techniques, skills, and tools necessary for computing practice</i> ”.
k	CSE 421/521 assignments increase in complexity as the semester goes on, allowing students to “ <i>apply design and development principles in the construction of software systems of varying complexity</i> ”.

OUTLINE

I reserve the right to alter this rough outline as needed to keep the class current, and our completion of the material will depend on the pace that we are able to establish and your understanding of the material.

- **Processes and the system call interface.**
- **Abstracting and multiplexing the CPU.**
 - Interrupts.
 - Context switches.
 - The thread abstraction.
 - Synchronization.
 - * Atomicity and concurrency.
 - * Critical sections.
 - * Synchronization primitives: locks, semaphores, and condition variables.
 - * Solving synchronization problems.
 - Thread scheduling.
- **Abstracting and multiplexing memory.**
 - The address space abstraction.
 - Virtual addresses.
 - Efficient address translation.
 - Segmentation and paging.
 - Swapping.
 - Page replacement policies.
- **Abstracting and multiplexing disks.**

- Basics of disk operation.
- The file abstraction.
- Filesystem basics.
- Filesystem structures.
- Filesystem operations.
- Filesystem caching.
- The Berkeley Fast File Systems (FFS).
- Log-structured filesystems.
- **Operating system structure: micro, macro, exo and multikernels.** 04/15.
- **Performance improvement.**
 - Measurement.
 - Benchmarking.
 - Analysis.
 - Improvement and Amdahl's Law.
- **Hardware virtualization.**
 - Intro to virtualization.
 - Types of virtualization.
 - Full hardware virtualization.
 - Binary translation and paravirtualization.
- Special topics (time permitting).

PROGRAMMING ASSIGNMENTS

The course includes four programming assignments of increasing difficulty. The assignments themselves are hosted on the www.ops-class.org course website. You also use the website to submit your answers and view your grades. The programming portions of the assignment are graded automatically and you may submit them as often as you like, using the autograder output to improve your submission. Questions that are graded by the course staff may be submitted twice, since they must be graded each time. Each question also has a rubric which indicates exactly how each portion of the question was evaluated and points assigned.

All programming assignments are done in pairs. **Both students in each pair receive the same grade for each programming assignment.** Each programming assignment also has specific collaboration guidelines that you must indicate you have followed each time you submit answers.

A description of each assignment along with due dates are listed below. This year we expect these to be firm and **no extensions will be given.**

- **ASST0: Introduction to OS/161**—Due Friday February 13th @ 5PM EST.
Introduces you to the programming environment you will be working in this semester, including the OS/161 operating system, the sys161 simulator, the GNU debugger (GDB), and the Git revision control system. Consists of code reading questions, a few simple scripting tasks, and a very simple implementation task.
- **ASST1: Synchronization**—Due Friday February 13th @ 5PM EST.
Your first real taste of kernel programming. After completing a set of code reading questions, you implement locks, condition variables and reader-writer locks. Next, you use them to solve a few simple toy synchronization problems.
- **ASST2: System Calls and Process Support**—Codereading and design due Friday February 20th @ 5PM EST; implementation due Friday March 13th @ 5PM EST.
The first big and complex assignment. Start by submitting a design that indicates you understand all of the moving pieces and what to do. Next, implement the system call interface. When you are finished, your kernel should be able to run user programs.

- **ASST3: Virtual Memory**—Codereading and design due Friday April 3rd @ 5PM EST; implementation due Friday May 15th @ 5PM EST.

The summit of the CSE 421/521 mountain. A large amount of code to implement and many internal interfaces to design. As always, start with a careful design. Then implement virtual memory, including address translation, TLB management, page replacement and swapping. When you are finished, your kernel should be able to run forever without running out of memory, and you will have completed the course.

GRADING POLICY

Grading is evenly divided between conceptual material and programming assignments.

50% Conceptual

1. **4% Preterm Exam.** If you take the preterm exam, you receive 4%. If you do not, your midterm and final exam scores are scaled to fill in the missing 4%.
2. **12% Midterm Exam**
3. **24% Final Exam**
4. **10% Participation.** Awarded at the discretion of the course staff.

50% Programming: ASST0 (5%), ASST1 (10%), ASST2 (15%), ASST3 (20%).

INCOMPLETE POLICY

Please refer to the [University at Buffalo Undergraduate Incomplete Policy²](#) or the [University at Buffalo Graduate School Incomplete Policy¹](#), as appropriate. Of particular importance is this language from the undergraduate incomplete policy (the graduate language is similar):

Students may only be given an “I” grade if they have a passing average in coursework that has been completed and have well-defined parameters to complete the course requirements that could result in a grade better than the default grade. **An “I” grade may not be assigned to a student who did not attend the course.**

Note that for graduate students, “the default grade accompanying an interim grade of ‘I’ shall be ‘U’ and will be displayed on the UB record as ‘IU’.”

TEXTBOOK

There is no required textbook for this course. You can consider “Modern Operating Systems” by Andrew Tannenbaum to be a supplemental reference for those interested in learning more.

EXAMS

A preterm exam will be held during the first week of class. The midterm will be scheduled for the week before Spring Break. A final will also be held at the end of the semester. Times and locations for all exams will be posted on the website. Please contact the course staff as soon as possible if you cannot attend a scheduled exam for any reason.

GETTING HELP

The CSE 421/521 programming assignments are difficult and most students require a fair amount of help during the semester. Here’s how to—and how not to—get help.

These are great ideas:

- **Use the forum.** This is by far your best resource because it allows you to get help from anyone—not just a TA or Ninja—at any time—not just during office hours. Please use and contribute to this valuable shared resource.

¹<http://grad.buffalo.edu/Academics/Policies-Procedures/Grading-Procedures.html#incomplete>

²<http://undergrad-catalog.buffalo.edu/policies/grading/explanation.shtml#incomplete>

- **Come to office hours.** We don't hold them for our health and the staff gets bored when there isn't anyone to help! So please don't hesitate to come in. Office hours are also a great time to work on your assignments, since if (when) you get stuck help is already nearby.

These are things not to do:

- **Emailing any staff member using their @buffalo.edu email address.** I instruct the staff to ignore these emails and I will as well.
- **Emailing staff@ops-class.org.** This address is only for administrative uses, not for getting help on assignments.
- **Emailing prof@ops-class.org.** This address is only for highly-sensitive administrative uses, not for getting help on assignments.

ACADEMIC INTEGRITY

Please review the [CSE Department Academic Integrity Policy](#)⁵ and the [University at Buffalo Undergraduate Academic Integrity Policy](#)⁴ or the [University at Buffalo Graduate School Academic Integrity Policy](#)³, as appropriate, to familiarize yourself with the relevant academic integrity policies and procedures. In general, the rule of thumb is that talking *about* code in English is OK, but talking *in* code is cheating. Each assignment has specific guidelines about what types of collaboration are encouraged, discouraged, and forbidden. We will use automated plagiarism detection software to check every submission against solutions submitted in prior years as well as all publicly-available solutions online.

Students that submit plagiarized work will receive a grade of F for the course.

STUDENTS WITH DISABILITIES

Please register and coordinate with the Office of Disability Services. Let the course staff know when accommodations need to be made. We are committed to helping you learn!
